Monitoring for Atmospheric Studies Alexis Le Pichon,Elisabeth Blanc,Alain Hauchecorne,2018-10-26 Since the publication of the first volume *Infrasound monitoring for atmospheric studies* published in 2010 significant advances were achieved in the fields of engineering propagation modelling and atmospheric remote sensing methods The global infrasound network which consists of the International Monitoring Network IMS for nuclear test ban verification completed by an increasing number of regional cluster arrays deployed around the globe has evidenced an unprecedented potential for detecting locating and characterizing various natural and man made sources In recent years infrasound has evolved into a broad interdisciplinary field encompassing academic disciplines of geophysics and innovative technical and scientific developments The advances in innovative ground based instruments including infrasound inversions for continuous observations of the stratosphere and

mesosphere provide useful insights into the geophysical source phenomenology and atmospheric processes involved. Systematic investigations into low frequency infrasound signals and the development of complementary observational platforms point out new insights into the dynamics of the middle atmosphere which play a significant role in both tropospheric weather and climate. This monitoring system also provides continuous relevant information about natural hazards with high societal benefits like on going volcanic eruptions, surface earthquakes, meteorites or severe weather. With this new edition, researchers and students benefit from a comprehensive content of both fundamental and applied interdisciplinary topics.
