✓ Exclusively available on IvyPanda

Air and water pollutions are the two major pollutions experienced in our day to day activities. Air pollution entails various contaminants in the atmosphere. Air pollution is well known to affect the human health and environment considerably. Air pollution occurs in form of air gases pollutants or particles that can occur either in limited scales such as indoor air pollutants or can happen in large scales and become an international concern. Some of the gases that have been linked with air pollution include carbon, sulfur, and nitrogen oxide among others (Weather Almanac, 2002). The major sources of air pollutants are exhaust fumes from automotive and industrial combustions. The current increased use of petroleum products has enhanced air pollution greatly. On the other hand, water pollution occurs when a lot of water pollutants such as chemicals or organic matter are added to the water. Water pollution can result during rainy season when the surface runoff carries agricultural chemicals and herbicides to neighboring water bodies. Consequently water pollution results when industries dispose their waste into water bodies (Green Sowers solutions, n.d). Poor sewerage system is also associated with water pollution and especially in the urban areas. Poor sewerage systems, automotive and industrial wastes are the major causes of water and air pollutions in Bangkok, Bangladeshi and Mexico City.

In many cities worldwide air pollution has been an issue of concern for a very long time. Air pollution has been enhanced by the high increase in population in the 21st century. The Bangkok City the capital city of Thailand is among the cities that have been greatly affected by air pollution as a result of their amplified pollution. Bangkok air pollution is associated with the many vehicles found there. The number of vehicles in Bangkok increased from 600,000 in 1980 to 5,614,294 vehicles by 2007. Nowadays the number of vehicles in Bangkok has greatly augmented since then. The high number of vehicles in the city has greatly promoted air pollution in the area. Similarly in Bangkok City, water pollution is very widespread. This is because the city does not have appropriate sewerage system. This makes domestic wastes being discharged to public drains without first being treated. The household septic tanks that are found in Bangkok have outlets that drain to public canals or drains. Moreover some of the septic tanks found in Bangkok are designed to permit the liquid waste to percolate into the ground.

web solution we use the relation $n = n_0 \left(\frac{1}{2} \right)^{\frac{t}{T}}$ where n is the remaining amount, n_0 is the initial amount, t is the time, and T is the half-life. For example, if a sample of 100 g of a substance decays to 30 g in 16 days, and the half-life is 4 days, we can calculate the initial mass of the sample. When we have n and t , rearranging the equation gives us $n_0 = n \left(2 \right)^{\frac{t}{T}}$.
