Coombs,2005-03-30 In the first early years of aviation the control systems and instruments found in a typical aircraft cockpit were few and simple but did form the basic pattern of requirements still used today Although pioneering aeroplanes seldom achieved speeds above 100 mph or reached altitudes above 10 000 feet pilots still required reliable information on speed altitude attitude engine condition and compass direction Instruments and controls were designed and positioned for mechanical convenience rather than pilot comfort This situation continued well into the 1930s and then the remarkable increase in aircraft performance created during World War II generated an altogether different working environment for pilots who now had to cope with a multitude of information sources and far more sophisticated control mechanisms Aircraft designers now considered how best to organise cockpits and flight decks to assist the pilot This is the history of how ergonomically designed civil and military aircraft cockpits and flight decks evolved Civil aircraft now regularly fly at transonic speeds at around 35 000 feet and military jets at twice the speed of sound on the edge of space These are demanding environments However modern cockpit technologies with simplified presentation of flight information and finger tip controls have eased pilot s tasks **Commerce Business Daily** ,1999 Aeronautical Engineering ,1993 A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in Scientific and technical aerospace reports STAR and International aerospace abstracts IAA **Aviation Automation** Charles E. Billings,2018-01-29 The advent of very compact very powerful digital computers has made it possible to automate a great many processes that formerly required large complex machinery Digital computers have made possible revolutionary changes in industry commerce and transportation This book an expansion and revision of the author s earlier technical papers on this subject describes the development of automation in aircraft and in the aviation system its likely evolution in the future and the effects that these technologies have had and will have on the human operators and managers of the system It suggests concepts that may be able to enhance human machine relationships in future systems The author focuses on the ability of human operators to work cooperatively with the constellation of machines they command and control because it is the interactions among these system elements that result in the system s success or

failure whether in aviation or elsewhere Aviation automation has provided great social and technological benefits but these benefits have not come without cost In recent years new problems in aircraft have emerged due to failures in the human machine relationship These incidents and accidents have motivated this inquiry into aviation automation Similar problems in the air traffic management system are predicted as it becomes more fully automated In particular incidents and accidents have occurred which suggest that the principle problems with today s aviation automation are associated with its complexity coupling autonomy and opacity These problems are not unique to aviation they exist in other highly dynamic domains as well The author suggests that a different approach to automation called human centered automation offers potential benefits for system performance by enabling a more cooperative human machine relationship in the control and management of aircraft and air traffic
