Mathematical Methods for Protein Structure Analysis and Design Concettina Guerra, Sorin Istrail, 2003-06-25 The papers collected in this volume reproduce contributions by leading scholars to an international school and workshop which was organized and held with the goal of taking a snapshot of a discipline undergoing tumultuous growth Indeed the area of protein folding docking and alignment is developing in response to needs for a mix of heterogeneous expertise spanning biology chemistry mathematics computer science and statistics among others Some

of the problems encountered in this area are not only important for the scientific challenges they pose but also for the opportunities they disclose in terms of medical and industrial exploitation. A typical example is offered by protein drug interaction docking a problem posing daunting computational problems at the crossroads of geometry, physics and chemistry and at the same time a problem with unimaginable implications for the pharmacopoeia of the future. The school focused on problems posed by the study of the mechanisms hindering protein folding and explored different ways of attacking these problems under objective evaluations of the methods. Together with a relatively small core of consolidated knowledge and tools, important reactions were brought to this effort by studies in a multitude of directions and approaches. It is obviously impossible to predict which if any among these techniques will prove completely successful but it is precisely the implicit dialectic among them that best conveys the current flavor of the field. Such unique diversity and richness inspired the format of the meeting and also explains the slight departure of the present volume from the typical format in this series: the exposition of the current
