Wood, 2012-01-11 This book challenges the assumption that morphological data are inherently unsuitable for phylogeny reconstruction argues that both molecular and morphological phylogenies should play a major role in systematics and provides the most comprehensive review of the comparative anatomy homologies and evolution of the head neck pectoral and upper limb muscles of primates Chapters 1 and 2 provide an introduction to the main aims and methodology of the book Chapters 3 and 4 and Appendices I and II present the data obtained from dissections of the head neck pectoral and upper limb muscles of representative members of all the major primate groups including modern humans and compare these data with the information available in the literature Appendices I and II provide detailed textual attachments innervation function variations and synonyms and visual high quality photographs information about each muscle for the primate taxa included in the cladistic study of Chapter 3 thus providing the first comprehensive and up to date overview of the comparative anatomy of the head neck pectoral and upper limb muscles of primates The most parsimonious tree obtained from the cladistic analysis of 166 head neck pectoral and upper limb muscle characters in 18 primate genera and in representatives of the Scandentia Dermoptera and Rodentia is fully congruent with the evolutionary molecular tree of Primates thus supporting the idea that muscle characters are particularly useful to infer phylogenies The combined anatomical materials provided in this book point out that modern humans have fewer head neck pectoral and upper limb muscles than most other living primates but are consistent with the proposal that facial and vocal communication and specialized thumb movements have probably played an important role in recent human evolution This book will be of interest to primatologists comparative anatomists functional morphologists zoologists physical anthropologists and systematians as well as to medical students physicians and researchers interested in understanding the origin evolution homology and variations of the muscles of modern humans Contains 132 color plates

Su, 2015-12-22. This volume describes a 3.6 million years old partial skeleton of *Australopithecus afarensis* from the Woranso Mille central Afar Ethiopia. This specimen is the first adult partial skeleton to be recovered since Lucy's AL 288-1 discovery in 1974. It is older than Lucy by 400,000 years and sheds light on the paleobiology of early *Australopithecus afarensis* particularly the morphology of the shoulder girdle and thoracic shape which are thus far poorly understood and actively debated. The fauna associated with the partial skeleton tells us enormously about *Au. afarensis* paleoecology and give us another piece of the puzzle regarding habitat availability and use for *Au. afarensis* outside the Hadar region where it has been well known for the last four decades.
