Bioremediation and Sustainability Romeela Mohee,Ackmez Mudhoo,2012-04-02 Bioremediation and Sustainability is an up to date and comprehensive treatment of research and applications for some of the most important low cost green emerging technologies in chemical and environmental engineering Sustainable development requires the development and promotion of environmental management and a constant search for green technologies to treat a wide range of aquatic and terrestrial habitats contaminated by increasing anthropogenic activities with the main sources of

contaminants being the chemical industries Bioremediation is a technique that uses living organisms in order to degrade or transform contaminants into their less toxic forms It is based on the existence of microorganisms with the capacity to attack the compounds on the enzymatic level Bioremediation is an increasingly popular low cost alternative to conventional methods for treating wastes and contaminated media with the possibility to degrade these contaminants using natural microbial activity mediated by different consortia of microbes Over the last few years the scientific literature has revealed the progressive emergence of various bioremediation techniques Bioremediation and Sustainability presents an up to date and comprehensive collection of chapters prepared in bioremediation technology research and applications The strategies covered in this volume can be applied in situ or ex situ depending on the site in which they will be applied In situ is the treatment done in the site of the contamination and ex situ involves the removal of soil or water to subsequent treatment There is a wide variety of techniques that have been developed in the past and are covered in this volume such as natural attenuation bioaugmentation biostimulation biosorption composting phytoremediation rhizoremediation and bioleaching

sometimes suggests the location and severity of embolism thrombosis while often the clinical features are unspecific requiring multiple investigations to establish the diagnosis An important dilemma encountered by the physicians who needs to treat patients with arterial embolism or venous thrombosis is when to initiate and stop the anticoagulant treatment considering the frail balance between the increased thrombotic risk versus the hazard of bleeding which frequently represents a serious concern Thus the management of this category of patients raises multiple problems as the physician must choose the correct drug and dose intensity and duration of the anticoagulant antithrombotic therapy The risk or recurrence is often difficult to appreciate and frequently requires elaborated laboratory examinations sometimes even genetic testing The development of new diagnostic therapeutic methods and protocols is needed to facilitate a precocious diagnosis which allows an easier and more accurate quantification of the risk of recurrent thrombosis while also decreasing the bleeding hazard This new insight into the process of haemostasis and thrombosis requires clinical imagistic and genetical assessments and therapeutic approaches Machine learning may prove its utility in helping the physicians to establish suitable protocols Along with data analysis these algorithms may assist the physicians in the diagnosis and treatment of patients with cardiovascular pathology especially of those with coagulopathies Hemodynamic analysis facilitates a personalised diagnosis and individualised treatment of thrombosis The patient specific hemodynamic modelling is enabled by 3D reconstruction of the blood vessels from the medical imagistic along with invasive and non invasive measurements of flow patterns This Research Topic focuses on original articles reviews meta analysis and case reports referring to groundbreaking research regarding thrombosis and haemostasis
