Asymptotic Geometric Analysis Monika Ludwig, Vitali D. Milman, Vladimir Pestov, Nicole Tomczak-Jaegermann, 2013-03-27

Asymptotic Geometric Analysis is concerned with the geometric and linear properties of finite dimensional objects normed spaces and convex bodies especially with the asymptotics of their various quantitative parameters as the dimension tends to infinity The deep geometric probabilistic and combinatorial methods developed here are used outside the field in many areas of mathematics and mathematical sciences The Fields Institute Thematic Program in the Fall of 2010 continued an established tradition of previous large scale programs devoted to the same general research direction The main directions of the program included Asymptotic theory of convexity and normed spaces Concentration of measure and isoperimetric inequalities optimal transportation approach Applications of the concept of concentration Connections with transformation groups and Ramsey theory Geometrization of probability Random matrices Connection with asymptotic combinatorics and complexity theory These directions are represented in this volume and reflect the present state of this important area of research It will be of benefit to researchers working in a wide range of mathematical sciences in particular functional analysis combinatorics convex geometry dynamical systems operator algebras and computer science

Regulators in Analysis, Geometry and Number Theory Alexander Reznikov, Norbert Schappacher, 2012-12-06 This book is an outgrowth of the Workshop on Regulators in Analysis Geometry and Number Theory held at the Edmund Landau Center for Research in Mathematical Analysis of The Hebrew University of Jerusalem in 1996 During the preparation and the holding of the workshop we were greatly helped by the director of the Landau Center Lior Tsafiri during the time of the planning of the conference and Hershel Farkas during the meeting itself Organizing and running this workshop was a true pleasure thanks to the expert technical help provided by the Landau Center in general and by its secretary Simcha Kojman in particular We would like to express our hearty thanks to all of them However the articles assembled in the present volume do not represent the proceedings of this workshop neither could all contributors to the book make it to the meeting nor do the contributions herein necessarily reflect talks given in Jerusalem In the introduction we outline our view of the theory to which this volume intends to contribute The crucial objective of the present volume is to bring together concepts methods and results from analysis differential as well as algebraic geometry and number theory in order to work towards a deeper and more comprehensive understanding of regulators and secondary invariants Our thanks go to all the participants of the workshop and authors of this volume May the readers of this book enjoy and profit from the combination of mathematical ideas here documented

Asymptotic Geometric Analysis, Part I Shiri Artstein-Avidan, Apostolos Giannopoulos, Vitali D. Milman, 2015-06-18 The authors present the theory of asymptotic geometric analysis a field which lies on the border between geometry and functional analysis In this field isometric problems that are typical for geometry in low dimensions are substituted by an isomorphic point of view and an asymptotic approach as dimension tends to infinity is introduced Geometry

and analysis meet here in a non trivial way Basic examples of geometric inequalities in isomorphic form which are encountered in the book are the isomorphic isoperimetric inequalities which led to the discovery of the concentration phenomenon one of the most powerful tools of the theory responsible for many counterintuitive results A central theme in this book is the interaction of randomness and pattern At first glance life in high dimension seems to mean the existence of multiple possibilities so one may expect an increase in the diversity and complexity as dimension increases However the concentration of measure and effects caused by convexity show that this diversity is compensated and order and patterns are created for arbitrary convex bodies in the mixture caused by high dimensionality The book is intended for graduate students and researchers who want to learn about this exciting subject Among the topics covered in the book are convexity concentration phenomena covering numbers Dvoretzky type theorems volume distribution in convex bodies and more

Geometric Aspects of Functional Analysis Bo'az Klartag,Emanuel Milman,2020-07-08 Continuing the theme of the previous volumes these seminar notes reflect general trends in the study of Geometric Aspects of Functional Analysis understood in a broad sense Two classical topics represented are the Concentration of Measure Phenomenon in the Local Theory of Banach Spaces which has recently had triumphs in Random Matrix Theory and the Central Limit Theorem one of the earliest examples of regularity and order in high dimensions Central to the text is the study of the Poincaré and log

Sobolev functional inequalities their reverses and other inequalities in which a crucial role is often played by convexity assumptions such as Log Concavity The concept and properties of Entropy form an important subject with Bourgain's slicing problem and its variants drawing much attention Constructions related to Convexity Theory are proposed and revisited as well as inequalities that go beyond the Brunn Minkowski theory One of the major current research directions addressed is the identification of lower dimensional structures with remarkable properties in rather arbitrary high dimensional objects In addition to functional analytic results connections to Computer Science and to Differential Geometry are also discussed

Geomorphic Analysis of River Systems Kirstie A. Fryirs,Gary J. Brierley,2012-12-10 Filling a niche in the geomorphology teaching market this introductory book is built around a 12 week course in fluvial geomorphology Reading the landscape entails making sense of what a riverscape looks like how it works how it has evolved over time and how alterations to one part of a catchment may have secondary consequences elsewhere over different timeframes These place based field analyses are framed within their topographic climatic and environmental context Issues and principles presented in the first part of this book provide foundational understandings that underpin the approach to reading the landscape that is presented in the second half of the book In reading the landscape detective style investigations and interpretations are tied to theoretical and conceptual principles to generate catchment specific analyses of river character behaviour and evolution including responses to human disturbance This book has been constructed as an introductory text on river landscapes providing a bridge and or companion to quantitatively framed or modelled approaches to landscape analysis that are addressed elsewhere Key principles outlined in the book emphasise the importance of complexity contingency and emergence in interpreting the character behaviour and evolution of any given system The target audience is second and third year undergraduate students in geomorphology hydrology earth science and environmental science as well as river practitioners who use geomorphic understandings to guide scientific and or management applications The primary focus of Kirstie and Gary's research and teaching entails the use of geomorphic principles as a tool with which to develop coherent scientific understandings of river systems and the application of these understandings in management practice Kirstie and Gary are co developers of the River Styles Framework and Short Course that is widely used in river management decision making and training Additional resources for this book can be found at www.wiley.com/go/fryirs_riversystems *Signals and Systems Analysis In Biomedical Engineering* Robert B.
