Air Pollution Control, 2015 **Air Pollution Control** C. David Cooper, F. C. Alley, 2010-08-25 A 25 year tradition of excellence is extended in the Fourth Edition of this highly regarded text. In clear authoritative language the authors discuss the philosophy and procedures for the design of air pollution control systems. Their objective is twofold: to present detailed information on air pollution and its control and to provide formal design training for engineering students. New to this edition is a comprehensive chapter on carbon dioxide control, perhaps the most critical emerging issue in the field. Emphasis is on methods to reduce carbon dioxide emissions and the technologies for carbon capture and sequestration. An expanded discussion of control technologies for coal fired power plants includes details on the capture of NO_x and mercury emissions. All chapters have been revised to reflect the most recent information on U.S. air quality trends and standards. Moreover, where available, equations for equipment cost estimation have been updated to the present time. Abundant illustrations clarify the concepts presented while numerous examples and end of chapter problems reinforce the design principles and provide opportunities for students to enhance their problem solving skills. **Air Pollution Calculations** Daniel A. Vallero, 2019-05-03 **Air Pollution Calculations** introduces the equations and formulae that are most important to air pollution but goes a step further. Most texts lack examples of how these equations and formulae apply to the quantification of real world scenarios and conditions. The ample example calculations apply to current air quality problems including emission inventories, risk estimations, biogeochemical cycling assessments and efficiencies in air pollution control technologies. In addition, the book explains thermodynamics and fluid dynamics in step by step and understandable calculations using air quality and multimedia modeling, reliability engineering and engineering economics using practical examples likely to be encountered by scientists, engineers, managers and decision makers. The book touches on the environmental variables, constraints and drivers that can influence pollutant mass, volume and concentrations which in turn determine toxicity and adverse outcomes caused by air pollution. How the pollutants form, move, partition, transform and find their fate are explained using the entire range of atmospheric phenomena. The control, prevention and mitigation of air pollution are explained based on physical, chemical and biological principles which is crucial to science based policy and decision making. Users will find this to be a comprehensive single resource that will help them understand air pollution, quantify existing data and help those whose work is impacted by air pollution. Explains air pollution in a comprehensive manner enabling readers to understand how to measure and assess risks to human populations and ecosystems actually or potentially exposed to air pollutants. Covers air pollution from a multivariate systems approach bringing in atmospheric processes, health impacts, environmental impacts, controls and prevention. Facilitates an understanding of broad factors like climate and transport that influence patterns and change in pollutant concentrations both spatially and over time. **Solutions Manual to Accompany Air Pollution Control a Design Approach** C.
