BREATH IN ... BREATH OUT

The mechanism of respiration involves the contraction and relaxation of the diaphragm and the intercostal muscles. This is dependent on the pressure changes in the thoracic cavity and the external atmosphere.

## Mechanism of Respiration

- Inhalation - The process of breathing in. The diaphragm contracts and moves down, and the intercostal muscles contract and pull the rib cage outwards and upwards. This increases the volume of the thoracic cavity, and the pressure inside decreases, causing air to be drawn in.
- Exhalation - The process of breathing out. The diaphragm relaxes and moves up, and the intercostal muscles relax. This decreases the volume of the thoracic cavity, and the pressure inside increases, causing air to be forced out.

- Trachea:** The windpipe, which carries air in and out of the lungs.
- Bronchi:** The airways that branch out from the trachea into the lungs.
- Alveoli:** The small air sacs where gas exchange takes place.
- Capillaries:** The small blood vessels that surround the alveoli.
- Diaphragm:** The muscle that separates the thoracic cavity from the abdominal cavity.
- Intercostal muscles:** The muscles between the ribs that help with breathing.
