

C. Return to the following pedigree for questions 12 – 16.

12. The pedigree above shows a family's pedigree for colorblindness. Which row contains the numbers of colorblindness and not have it? From the pedigree above, it can be seen that only the females are carriers for colorblindness
13. Based on your answer to question 12, what kind of trait is colorblindness? Sex linked, recessive. Sex Y linked recessive disorder. Two recessive alleles are needed to cause disease in females and one recessive allele is enough to cause disease in males. This is because males have XY and females have XX. If there is female has one dominant and one recessive allele then she will be a carrier for the disease or disorder.
14. Why does individual IV-7 have colorblindness? The father of IV-7 is colorblind and her mother is a carrier. Therefore she received one allele from both parents.
15. Why do all the daughters in generation II carry the colorblind gene? They all carry the colorblind gene because their father is colorblind, thus they all received the recessive allele from him.
16. Identify or name the colorblind males in generations IV. The colorblind males in generations IV are IV-1 and IV-5.

Traboulsi, Professor of Ophthalmology and Director Center for Genetic Eye Diseases Elias I Traboulsi, MD, Virginia Miraldi Utz, Department Chair Pediatric & Neuro-Ophthalmology Arif O Khan, 2025-08-22

Since the publication of the Human Genome Project in 2001 and the development of Genome Wide Association Studies GWAS there has been a major shift toward large scale international collaboration in genetic eye disease research Eye researchers involved in genetics have now joined forces with traditional epidemiologists to develop the field of genetic epidemiology Whilst ophthalmic geneticists had focused on rare pathogenic variants mutations with strong effects epidemiologists had focused on common gene variants with small but additive effects see Figure 1 These two areas have now merged identifying a spectrum of genetic variants that are rare intermediate or common with strong medium or mild pathogenicity **Pedigree Analysis in Human Genetics** Elizabeth Alison Thompson, 1986 **Novel Approaches to the Analysis of Family Data in Genetic Epidemiology** Xiangqing Sun, Jill S.

Barnholtz-Sloan, Nathan Morris, Robert C. Elston, 2016-08-17 Genome wide association studies GWAS for complex disorders with large case control populations have been performed on hundreds of traits in more than 1200 published studies <http://www.genome.gov/gwastudies> but the variants detected by GWAS account for little of the heritability of these traits leading to an increasing interest in using family based designs While GWAS studies are designed to find common variants with low to moderate attributable risks family based studies are expected to find rare variants with high attributable risk Because family based designs can better control both genetic and environmental background this study design is robust to heterogeneity and population stratification Moreover in family based analysis the background genetic variation can be modeled to control the residual variance which could increase the power to identify disease associated rare variants Analysis of families can also help us gain knowledge about disease transmission and inheritance patterns Although a family based design has the advantage of being robust to false positives novel and powerful methods to analyze families in genetic epidemiology continue to be needed especially for the interaction between genetic and environmental factors associated with disease Moreover with the rapid development of sequencing technology advances in approaches to the design and analysis of sequencing data in families are also greatly needed The 11 articles in this book all introduce new methodology and using family data substantial new findings are presented in the areas of infectious diseases diabetes eye traits autism spectrum disorder and prostate cancer
