Rigorous Numerics in Dynamics Jan Bouwe van den Berg,Jean-Philippe Lessard,2018-07-12 This volume is based on lectures delivered at the 2016 AMS Short Course Rigorous Numerics in Dynamics held January 4 5 2016 in Seattle Washington Nonlinear dynamics shapes the world around us from the harmonious movements of celestial bodies via the swirling motions in fluid flows to the complicated biochemistry in the living cell Mathematically these phenomena are modeled by nonlinear dynamical systems in the form of ODEs PDEs and delay equations The presence of nonlinearities complicates the analysis and the difficulties are even greater for PDEs and delay equations which are naturally defined on infinite dimensional function spaces With the availability of powerful computers and sophisticated software numerical simulations have quickly become the primary tool to study the models However while the pace of progress increases one may ask just how reliable are our computations Even for finite dimensional ODEs this question naturally arises if the system under study is chaotic as small differences in initial conditions such as those due to rounding errors in numerical computations yield wildly diverging outcomes These issues have motivated the development of the field of rigorous numerics in dynamics which draws inspiration from ideas in scientific computing numerical analysis and approximation theory The articles included in this volume present novel techniques for the rigorous study of the dynamics of maps via the Conley index theory periodic orbits of delay differential equations via continuation methods invariant manifolds and connecting orbits the dynamics of models with unknown nonlinearities and bifurcations diagrams **Encyclopedia of Associations V1 National Org 43 Pt1**

Mathematical Foundations of Neuroscience G. Bard Ermentrout,David H. Terman,2010-07-01 This book applies methods from nonlinear dynamics to problems in neuroscience It uses modern mathematical approaches to understand patterns of neuronal activity seen in experiments and models of neuronal behavior The intended audience is researchers interested in applying mathematics to important problems in neuroscience and neuroscientists who would like to understand how to create models as well as the mathematical and computational methods for analyzing them The authors take a very broad

approach and use many different methods to solve and understand complex models of neurons and circuits They explain and combine numerical analytical dynamical systems and perturbation methods to produce a modern approach to the types of model equations that arise in neuroscience There are extensive chapters on the role of noise multiple time scales and spatial interactions in generating complex activity patterns found in experiments The early chapters require little more than basic calculus and some elementary differential equations and can form the core of a computational neuroscience course Later chapters can be used as a basis for a graduate class and as a source for current research in mathematical neuroscience The book contains a large number of illustrations chapter summaries and hundreds of exercises which are motivated by issues that arise in biology and involve both computation and analysis Bard Ermentrout is Professor of Computational Biology and Professor of Mathematics at the University of Pittsburgh David Terman is Professor of Mathematics at the Ohio State University
