Glibert, 2024-08-12 Phytoplankton or algae are the engines of the Earth They form the base of the aquatic food web and although microscopic they produce 50% of the oxygen in the air Many of our ideas of what makes these cells tick come from ideas developed decades ago But lakes and oceans are changing and so too are phytoplankton Our understanding has to change accordingly Nutrient pollution is a major problem worldwide and climate is changing altering temperature CO₂ and pH as well as the physics that control water stratification All of these factors control which species of phytoplankton may grow well at any particular time While algae grow in all types of aquatic systems not all algae are favorable for the production of fish and other food resources The prevalence of harmful algal blooms HABs has increased At the core of this effort is a drive to understand and to convey to researchers students and managers what kinds of phytoplankton are likely to thrive as conditions change and why this matters There has not yet been a synthetic summary that unravels the mysteries of phytoplankton in a modern world This book aims to provide such a resource **Forensic Recovery of Human Remains** Tosha L.
