graduate level students in engineering and mathematics we have selected for discussion subjects that are traditionally found in numerical analysis texts But our choice of methodology rejects the traditional where analysis and experience clearly warrant such a departure and one of our primary aspirations in this work is to equip the reader with the wherewithal to apply numerical analysis thinking to nontraditional subjects For there is a plethora of computer oriented sciences such as optimization statistics and system analysis and identification that are sorely in need of methods comparable to those related here for classical numerical analysis problems Toward uncovering for the reader the structure of numerical methods we have for example devoted a chapter to a metric space theory for iterative application of operators In this chapter we have collected those definitions and concepts of real and functional analysis that are requisite to a modern intermediate level exposition of the principles of numerical analysis Further we derive the abstract theory most notably the contraction mapping theorem for iteration processes
