Complex Analytic Geometry is a subject that could be termed in short as the study of the sets of common zeros of complex analytic functions It has a long history and is closely related to many other fields of Mathematics and Sciences where numerous applications have been found including a recent one in the Sato hyperfunction theory This book is concerned with among others local invariants that arise naturally in Complex Analytic Geometry and their relations with global invariants of the manifold or variety The idea is to look at them as residues associated with the localization of some characteristic classes Two approaches are taken for this topological and differential geometric and the combination of the two brings out further fruitful results For this on one hand we present detailed description of the Alexander duality in combinatorial topology On the other hand we give a thorough presentation of the ech de Rham cohomology and integration theory on it This viewpoint provides us with the way for clearer and more precise presentations of the central concepts as well as fundamental and important results that have been treated only globally so far It also brings new perspectives into the subject and leads to further results and applications The book starts off with basic material and continues by introducing characteristic classes via both the obstruction theory and the Chern Weil theory explaining the idea of localization of characteristic classes and presenting the aforementioned invariants and relations in a unified way from this perspective Various related topics are also discussed The expositions are carried out in a self containing manner and includes recent developments The profound consequences of this subject will make the book useful for students and researchers in fields as diverse as Algebraic Geometry Complex Analytic Geometry Differential Geometry Topology Singularity Theory Complex Dynamical Systems Algebraic Analysis and Mathematical Physics

Digital Image Processing and Analysis Scott E Umbaugh,2023-01-18 Computer Vision and Image Analysis focuses on techniques and methods for image analysis and their use in the development of computer vision applications The field is advancing at an ever increasing pace with applications ranging from medical diagnostics to space exploration The diversity of applications is one of the driving forces that make it such an exciting field to be involved in for the 21st century This book presents a unique engineering approach to the practice of computer vision and image analysis which starts by presenting a global model to help gain an understanding of the overall process followed by a breakdown and explanation of each individual topic Topics are presented as they become necessary for understanding the practical imaging model under study which provides the reader with the motivation to learn about and use the tools and methods being

explored The book includes chapters on image systems and software image analysis edge line and shape detection image segmentation feature extraction and pattern classification Numerous examples including over 500 color images are used to illustrate the concepts discussed Readers can explore their own application development with any programming languages including C C MATLAB Python and R and software is provided for both the Windows C C and MATLAB environments The book can be used by the academic community in teaching and research with over 700 PowerPoint Slides and a complete Solutions Manual to the over 150 included problems It can also be used for self study by those involved with developing computer vision applications whether they are engineers scientists or artists The new edition has been extensively updated and includes numerous problems and programming exercises that will help the reader and student to develop their skills
