Department of Civil and Structural Engineering, 2012 Convenience and reliability in design of steel structures especially for angle members are another attraction for second order analysis and design method. The monosymmetric or asymmetric section property and eccentric connection in angle members further complicates its design process and many design codes provide different complex equations to consider these effects which can be simulated automatically in analysis model in the proposed method so that the design process can be much simplified. Steel members have been popularly used in different structural forms. Due to the increase of building height and structural span, the use of steel concrete composite members becomes more popular because of its advantages over bare steel and reinforced concrete members. Most nonlinear finite element packages are complicated and unsuitable for practical design because of the requirement of huge computational time. Therefore, an efficient and accurate analysis and design method which includes the nonlinear effects and fulfills code requirement is proposed for steel concrete composite members with verification examples to confirm its validity for practical applications. Consideration of material nonlinearity in study of inelastic behavior of composite members is obviously important and the second order inelastic analysis is proposed in the final part of the thesis to include both the geometric and material nonlinearities in analysis. Refined plastic hinge method in conjunction with initial and full yield surfaces is used to trace material yield for guaranteeing both efficiency and accuracy. In this thesis, extensive numerical examples are provided for verification.
