(c) The explanatory variable is the subspecies, the response variable is the wavelength of maximum retina sensitivity.
14. (a) No. The 500 households selected to receive the survey might be a random sample, but the low completion rate (< 20%) makes the sample a volunteer sample.
(b) Volunteer bias Those who volunteer to respond to a survey on recycling might have different opinions of the program than those who did not respond.
15. (a) Omitting cell phones could bias a sample. If younger individuals are more likely to use a cell phone, omitting cell phones would bias the sample towards older individuals. (b) Equal chance of being selected.

Cushman, Andrew J. Shirk, Glenn T. Howe, Melanie A. Murphy, Rodney J. Dyer, Stéphane Joost, 2018-08-03 Ecosystems are the stage on which the play of evolution is acted and ecosystems are complex spatially structured and temporally varying The purpose of this Research Topic is to explore critical challenges and opportunities for the transition from landscape genetics to landscape genomics Landscape genetics has focused on the spatial analysis of small genetic datasets typically comprised of less than 20 microsatellite markers taken from clusters of individuals in putative populations or distributed individuals across landscapes The recent emergence of large scale genomic datasets produced by next generation sequencing methods poses tremendous challenge and opportunity to the field Perhaps the greatest is to produce process curate archive and

analyze spatially referenced genomic datasets in a way such that research is led by a priori hypotheses regarding how environmental heterogeneity and temporal dynamics interact to affect gene flow and selection The papers in the Research Topic cover a broad range of topics under this area of focus from reviews of the emergence of landscape genetics to best practices in spatial analysis of genetic data The compilation like the emerging field itself is eclectic and illustrates the scope of both the challenges and opportunities of this emerging field **Horticultural Reviews, Volume 33** Jules

Weekly ,1966 **Biophysics and Cancer** Claudio Nicolini,2012-12-06 Since the early times of the Greek philosophers Leucippus and Democritus and later of the Roman philosopher Lucretius a simple fundamental idea emerged that brought the life sciences into the realm of the physical sciences Atoms after various interactions were assumed to acquire stable configurations that corresponded either to the living or to the inanimate world This simple and unitary theory which has evolved in successive steps to our present time remarkably maintained its validity despite several centuries of alternative vicissitudes and is the foundation of modern biophysics Some of the recent developments of this ancient idea are the discovery of the direct relationship between spatial structures and chemical activity of such molecules as methane and benzene and the later discovery of the three dimensional structure of double helical DNA and of its relationship with biological activity The relationship between the structure of various macromolecules and the function of living cells was one of the most striking advancements of modern science obtained by the cooperation of physicists chemists mathematicians engineers biologists and physicians This crossing of the life and physical sciences has given rise to new and exciting frontiers and to a new synthesis where there is a frequent interconnection of expertise and where there is an exchange of roles among

traditionally separated soft and hard sciences Even if knowledge is still transmitted to new generations within universities as separate disciplines new knowledge is acquired today in the laboratory by truly interdisciplinary teams **Novel Concepts**
