developments mainly due to the introduction of new concepts and techniques from molecular biology. Concomitantly basic scientists have become increasingly interested in problems of human genetics. More than 700 human genes have been mapped; genes of previously unsuspected complexity such as the gene for factor VIII have become known and the structure of noncoding DNA sequences is being analyzed with the aim of understanding gene regulation. DNA diagnosis is being rapidly introduced into medical genetics. All this as well as the extensive progress in most other fields of human and medical genetics had to be considered in the preparation of this second edition. The book has been extensively revised and rewritten. A substantial new section dealing with gene and chromosomal structure at the molecular level has been added. The newer knowledge of molecular genetics has been incorporated and the conceptual and practical contribution of DNA methods for example in the hemoglobinopathies and in some other diseases is discussed. Many new figures and tables have been added and some illustrative material has been replaced. We have read carefully the many friendly and sometimes flattering reviews of the first edition.
