science and technology to mount a critique on Cold War American society as they saw it conservative and constricting Motivated by the contemporary American Women s Movement these artists transformed science and technology into new modes of artmaking that transgressed modernist heroic painterly styles and subverted the traditional economic structures of the gallery the museum and the dealer At the same time the artists also embraced these domains of knowledge and practice as expressions of hope for a better future Many found inspiration in the scientific theory of open systems which investigated problems of wholeness dynamic interaction and organization enabling consideration of the porous boundaries between human bodies and their social political and nonhuman environments Filippone also establishes that the theory of open systems not only informed feminist art but also continued to influence women artists practice of reclamation and ecological art through the twenty first century

Looking Inside Jets Simone Marzani, Gregory Soyez, Michael Spannowsky, 2019-05-11 This concise primer reviews the latest developments in the field of jets Jets are collinear sprays of hadrons produced in very high energy collisions e g at the LHC or at a future hadron collider They are essential to and ubiquitous in experimental analyses making their study crucial At present LHC energies and beyond massive particles around the electroweak scale are frequently produced with transverse momenta that are much larger than their mass i e boosted The decay products of such boosted massive objects tend to occupy only a relatively small and confined area of the detector and are observed as a single jet Jets hence arise from many different sources and it is important to be able to distinguish the rare events with boosted resonances from the large backgrounds originating from Quantum Chromodynamics QCD This requires familiarity with the internal properties of jets such as their different radiation patterns a field broadly known as jet substructure This set of notes begins by providing a phenomenological motivation explaining why the study of jets and their substructure is of particular importance for the current and future program of the LHC followed by a brief but insightful introduction to QCD and to hadron collider phenomenology The next section introduces jets as complex objects constructed from a sequential recombination algorithm In this context some experimental aspects are also reviewed Since jet substructure calculations are multi scale problems that call for all order treatments resummations the bases of such calculations are discussed for simple jet quantities With these QCD and jet physics ingredients in hand readers can then dig into jet substructure itself Accordingly these notes first highlight the main concepts behind substructure techniques and introduce a list of the main jet substructure tools that have been used over the past decade Analytic calculations are then provided for several families of tools the goal being to identify their key characteristics In closing the book provides an overview of LHC searches and measurements where jet substructure techniques are used reviews the main take home messages and outlines future perspectives
