Plant reproduction is essential not only for producing offspring but also for increasing crop quality and yield. Moreover, plant reproduction entails complex growth and developmental processes which provide a variety of opportunities for elucidating fundamental principles in biology. The combinational employment of molecular genetic approaches and emerging technologies such as fluorescence-based imaging techniques and next-generation sequencing has led to important progresses in plant reproduction using model plants, crops, and trees. This e-book compiles 31 articles including 1 hypothesis and theory, 4 perspectives, 12 reviews, and 14 original research papers. Spicer, Juan D. Gaitan-Espitia, 2023-07-24. Anthropogenic climate change has driven widespread changes in marine environments, including ocean warming, ocean acidification, and the formation of hypoxic zones. Such environmental changes would pose direct challenges to the survival and adaptation of aquatic organisms, greatly affecting the biodiversity of marine life and marine ecosystems. Changes in the marine environment are likely to have strong effects at the physiological, behavioral, and molecular levels, with implications at the individual, population, and species levels, resulting in the degradation of genetic resources through massive mortality. For example, the ingestion, digestion, respiration, and growth of aquatic animals were greatly depressed under extreme

environments In the long run maintaining a sustainable ocean would require a better understanding of the adaptation of marine animals in response to the effects of multiple environmental stressors The Research Topic is aimed to discuss the potential impacts of individual and compounded extreme environments on aquatic animals as well as the regulatory mechanisms and adaptation strategies of marine species to cope with these impacts **Human Biology** Craig H.
