Phytoplankton Pigments Suzanne Roy, Carole A. Llewellyn, Einar Skarstad Egeland, Geir Johnsen, 2011-10-27 Pigments act as tracers to elucidate the fate of phytoplankton in the world's oceans and are often associated with important biogeochemical cycles related to carbon dynamics in the oceans They are increasingly used in in situ and remote sensing applications detecting algal biomass and major taxa through changes in water colour This book is a follow up to the 1997 volume *Phytoplankton Pigments in Oceanography* UNESCO Press Since then there have been many advances concerning phytoplankton pigments This book includes recent discoveries on several new algal classes particularly for the picoplankton and on new pigments It also includes many advances in methodologies including liquid chromatography mass spectrometry LC MS and developments and updates on the mathematical methods used to exploit pigment information and extract the composition of phytoplankton communities The book is invaluable primarily as a reference for students researchers and professionals in aquatic science biogeochemistry and remote sensing

Aerophytic Algae and Cyanobacteria Saúl Blanco, 2025-10-20 *Aerophytic Algae and Cyanobacteria Diversity Ecology and Biogeography* expands our understanding of microalgae and cyanobacteria that colonize air exposed substrates These species often overlooked in marine and freshwater studies play crucial roles in various ecosystems Introductory chapters cover their morphology physiological adaptations and biogeography highlighting their ecological significance and interactions within ecosystems Other sections addresses future research directions applications in environmental assessments conservation

water and air quality management bioremediation and pollution control The book authored by a global team of phycologists also explores taxa such as edaphic and corticolous diatoms aeroplanktonic protists and phototrophic phytotelmata Offers a comprehensive view of the diversity distribution and dispersal of aerophytic algae Discusses the importance of studying aerophytic algae their habitats and techniques used in their investigation Highlights the need for conservation discusses research gaps and provides a summary of existing studies *Phytoplankton Whispering: An Introduction to the Physiology and Ecology of Microalgae* Patricia M. Glibert, 2024-08-12 Phytoplankton or algae are the engines of the Earth They form the base of the aquatic food web and although microscopic they produce 50% of the oxygen in the air Many of our ideas of what makes these cells tick come from ideas developed decades ago But lakes and oceans are changing and so too are phytoplankton Our understanding has to change accordingly Nutrient pollution is a major problem worldwide and climate is changing altering temperature CO₂ and pH as well as the physics that control water stratification All of these factors control which species of phytoplankton may grow well at any particular time While algae grow in all types of aquatic systems not all algae are favorable for the production of fish and other food resources The prevalence of harmful algal blooms HABs has increased At the core of this effort is a drive to understand and to convey to researchers students and managers what kinds of phytoplankton are likely to thrive as conditions change and why this matters There has not yet been a synthetic summary that unravels the mysteries of phytoplankton in a modern world This book aims to provide such a resource

Interpretation and Implications of Variability in Ecological Systems Robert Klinger, Clare Aslan, Karen Thorne, 2024-07-22 Numerous hypotheses have been proposed to explain the dynamics in abundance of individual species how species interact how communities assemble and how interactions between biotic and abiotic processes shape ecosystem stability Many if not most of these hypotheses find some degree of support but often only within relatively narrow spatial and temporal ranges This is because conditions vary over time and from place to place and so the strength and extent of processes that were the focus of a given hypothesis become altered by other forces Ecologists have confronted variability from two perspectives conceptual and statistical Conceptually spatial and temporal variability are now recognized as being scale dependent and hierarchical Statistically there are many models that ecologists readily use that account for the hierarchical and scale dependence of variability present in many datasets But linking the two perspectives into a meaningful understanding of what variability means in real systems has been much less successful For example it is common to see studies where the fixed effects of a generalized linear mixed model are reported but very often random effects are completely ignored or at best given scant attention The likelihood of this being a significant problem increases greatly in what are rapidly becoming more common studies that utilize datasets spanning long temporal and or large spatial scales or when extreme and often unpredictable events gray and black swans occur
