Introduction

Thank you for purchasing the *Fire Bottle™* model FB-1A. This unique booster pedal features an all-tube signal path, modified 'Harvard' style tone control and selectable input impedance specially designed to enhance the tone of magnetic guitar pickups. The FB-1A can improve clarity for a bigger, bolder tone or fatten up the sound of a single coil pickup to give it the characteristic warmth of a humbucker pickup. Gain is continuously variable from 0dB (unity) to a huge 30dB allowing the *Fire Bottle* to operate as an audiophile unity gain buffer, clean boost or push a tube amp into overdrive.

The FB-1A is designed for flexibility, simplicity and outstanding sound quality. Audiophile grade components and silver solder are used throughout the circuit with precision metal-film resistors for low-noise and stability, polyester coupling capacitors for their ability to resolve fine signal detail and ground-plane layout. The result is an outstanding booster pedal that exhibits a level of purity and natural tone not found in solid-state germanium or silicon designs.

Thank you for trusting Effectrode to be your effects company. We wish you many years of musical enjoyment from this hand-built, all-tube pedal.

Tubes

The FB-1A signal path is based on a N.O.S. Sylvania mil-spec 6112 subminiature twin triode tube. Raytheon (meaning, "light of the Gods") developed subminiature tubes for military applications in the 1950s. The 6112 tube is manufactured to meet stringent Mil-E-1 specification for reliability and designed for long service life under conditions of severe shock, vibration (20,000G!), high temperature and high altitude. Subminiature tubes represent the pinnacle of tube technology and offer more consistent musical performance than early germanium transistors.

To extend tube life, it is recommended that the unit be allowed to warm-up for at least one minute after being switched on. This is to allow the heater filament in the tube to heat the cathode, which is coated with a layer of barium and strontium oxide. The oxide layer gets torn off the cathode, a process known as cathode stripping. If the cathode has not reached its correct operating temperature, if operated well within their ratings, good quality signal tubes can last 100,000 hours or more; that's well over 11 years of continuous use. If you use your pedal for only 4 hours a day, they should last over 25 years. (We must reserve the right to disavow excessive warranties)
