Experiment 8.1 – Implementing a Combinational Logic Circuit with Logic Gates, Multiplexers, and Registers

1. Introduction: This circuit is intended as a classroom exercise; it is simple, logical, logical gates and multiplexers being the only two building blocks. However, with enough logical thinking on the lab exercise, you should be able to design circuits made up of either combinational circuits alone or mixed (combinational logic) combinational and sequential logic.

2. Objectives: The purpose of Experiment 8.1 is to design combinational circuits with the minimum number of logic gates and multiplexers. You will be given a circuit, and you will design a circuit to implement it using logic gates and multiplexers.

3. Introduction:

We will implement a circuit that uses logic gates and multiplexers. The circuit is shown in Figure 8.1.1. The circuit is shown in Figure 8.1.1.

4. Experiment Objectives: The following objectives are required for this experiment:

- 1. The circuit is a combinational circuit (no feedback) and will be implemented using logic gates and multiplexers.
- 2. The circuit is a combinational circuit (no feedback) and will be implemented using logic gates and multiplexers.

The Dynamics of Digital Excitation Masakazu Shoji, 2012-12-06 The electronic circuit is a proud child of twentieth century natural science In a hundred short years it has developed to the point that it now enhances nearly every aspect of human life Yet our basic understanding of electronic circuit operation electronic circuit theory has not made significant progress during the semiconductor industry's explosive growth from 1950s to the present This is because the electronic circuit has never been considered to be a challenging research subject by physicists Linear passive circuit theory was established by the late 1940s After the advent of the semiconductor electron devices the interest of the technical community shifted away from circuit theory Twenty years later when integrated circuit technology began an explosive growth circuit theory was again left behind in the shadow of rapidly progressing computer aided design CAD technology The present majority view is that electronic circuit theory stands in a subordinate position to CAD and to device processing technology In 1950s and 1960s several new semiconductor devices were invented every year and each new device seemed to have some interesting fundamental physical mechanisms that appeared worth investigating Compared to attractive device physics the problems of the semiconductor device circuit appeared less sophisticated and less attractive Bright minds of the time drifted away from circuit theory to electron device physics After thirty years only one type of semiconductor device the electron triode with several variations survived whereas hundreds of them went into oblivion
