Hamerton,2012-12-06 After epoxy resins and polyimides cyanate esters arguably form the most well developed group of high temperature thermosetting polymers They possess a number of desirable performance characteristics which make them of increasing technological importance where their somewhat higher costs are acceptable The principal end uses for cyanate esters are as matrix resins for printed wiring board laminates and structural composites For the electronics markets the low dielectric loss characteristics dimensional stability at molten solder temperatures and excellent adhesion to conductor metals at temperatures up to 250 C are desirable In their use in aerospace composites unmodified cyanate esters offer twice the fracture toughness of multifunctional epoxies while achieving a service temperature intermediate between epoxy and bismaleimide capabilities Applications in radome construction and aircraft with reduced radar signatures utilize the unusually low capacitance properties of cyanate esters and associated low dissipation factors While a number of commercial cyanate ester monomers and prepolymer are now available to date there has been no comprehensive review of the chemistry and recent technological applications of this versatile family of resins The aims of the present text are to present these in a compact readable form The work is primarily aimed at materials scientists and polymer technologists involved in research and development in the chemical electronics aerospace and adhesives industries It is hoped that advanced undergraduates and postgraduates in polymer chemistry and technology and materials science technology will find it a useful introduction and source of reference in the course of their studies Applied Science & Technology Index ,1997

Rosenblueth,2016-11-21 The complexity of living organisms surpasses our unaided abilities of analysis Hence computational and mathematical methods are necessary for increasing our understanding of biological systems At the same time there has been a phenomenal recent progress allowing the application of novel formal methods to new domains This progress has spurred a conspicuous optimism in computational biology This optimism in turn has promoted a rapid increase in collaboration between specialists of biology with specialists of computer science Through sheer complexity however many important biological problems are at present intractable and it is not clear whether we will ever be able to solve such problems We are in the process of learning what kind of model and what kind of analysis and synthesis techniques to use for a particular problem Some existing formalisms have been readily used in biological problems others have been adapted to biological needs and still others have been especially developed for biological systems This Research Topic has examples of cases 1 employing existing methods 2 adapting methods to biology and 3 developing new methods We can also see discrete and Boolean models and the use of both simulators and model checkers Synthesis is exemplified by manual and by machine learning methods We hope that the articles collected in this Research Topic will
