

Medical nutrition in special cases

The non-intubated patient

41) In non-intubated patients not reaching the energy target with an oral diet, oral nutritional supplements should be considered first and then EN. (R41, GPP, 96%)

42) In non-intubated patients with dysphagia, texture-adapted food can be considered. If swallowing is proven unsafe, EN should be administered. (R42, GPP, 94%)

43) In non-intubated patients with dysphagia and a very high aspiration risk, postpyloric EN or, if not possible, temporary PN during swallowing training with removed nasointestinal tube can be performed. (R43, GPP, 92%)

The surgical patient

44) In patients after abdominal or esophageal surgery, early EN can be preferred over delayed EN. (R45, O, 96%)

45) In critically ill patients with surgical complications after abdominal or esophageal surgery and unable to eat orally, EN (rather than PN) should be preferred unless discontinuity or obstruction of GI tract, or abdominal compartment syndrome is present. (R46, GPP, 96%)

46) In the case of an unrepaired anastomotic leak, internal or external fistula, a feeding access distal to the defect should be aimed for to administer EN. (R47, GPP, 96%)

47) In the case of an unrepaired anastomotic leak, internal or external fistula, or if distal feeding access is not achieved, EN should be withheld and PN may be commenced. (R48, GPP, 100%)

48) In case of high output stoma or fistula, the appropriateness of chyme reinfusion or enterocolysis should be evaluated and performed if adequate. (R49, GPP, 100%)

The trauma patient

49) Trauma patients should preferentially receive early EN instead early PN. (R50, B, 96%)

The septic patient

50) Early and progressive EN should be used in septic patients after hemodynamic stabilization. If contraindicated, EN should be replaced or supplemented by progressive PN. (R44, GPP, 94%)

The obese patient

51) An iso-caloric high protein diet can be administered to obese patients, preferentially guided by indirect calorimetry measurements and urinary nitrogen losses. (R51, O, 89%)

52) In obese patients, energy intake should be guided by indirect calorimetry. Protein delivery should be guided by urinary nitrogen losses or lean body mass determination (using computerized tomography or other tools). If indirect calorimetry is not available, energy intake can be based on "adjusted body weight". If urinary nitrogen losses or lean body mass determination are not available, protein intake can be 1.3 g/kg "adjusted body weight"/d. (R52, GPP, 89%)
