relevant to non mathematics students and scientists but which they may not have seen or studied for a while These math issues can range from reading mathematical symbols to using complex numbers dealing with equations involved in calculating medication equivalents the General Linear Model GLM used in e g neuroimaging analysis finding the minimum of a function independent component analysis or filtering approaches Almost every student or scientist will at some point run into mathematical formulas or ideas in scientific papers that may be hard to understand given that formal math education may be some years ago In this book we will explain the theory behind many of these mathematical ideas and expressions and provide readers with the tools to better understand them We will revisit high school mathematics and extend and relate this to the mathematics you need to understand the math you may encounter in the course of your research This book will help you understand the math and formulas in the scientific papers you read To achieve this goal each chapter mixes theory with practical pen and paper exercises such that you re gain experience with solving math problems yourself Mnemonics will be taught whenever possible To clarify the math and help readers apply it each chapter provides real world and scientific examples In this new edition two new chapters covering statistics and differential equations have been added which have been workshopped in the authors popular lecture series in order to maximize the benefit for readers **Information**
