Abstract: *Phragmites australis* (Cyperaceae) is a dominant species in coastal wetlands of the United States. It is a highly invasive species that can outcompete native species and alter the structure and function of wetland ecosystems. The purpose of this study was to investigate the effects of *Phragmites* invasion on the structure and function of a coastal wetland. We measured the biomass, height, and density of *Phragmites* and native species in a wetland in Louisiana. We also measured the soil moisture, soil temperature, and soil nutrient levels in the wetland. The results of the study showed that *Phragmites* invasion significantly reduced the biomass, height, and density of native species. It also increased the soil moisture, soil temperature, and soil nutrient levels in the wetland. The study suggests that *Phragmites* invasion can have a significant impact on the structure and function of coastal wetlands.
