1 (b) Describe THREE abiotic changes that would be likely to result if the exotic worms consumed all the leaf litter in a single year. - CORRECT ANSWER-1. erosion of soil would increase

2. changes in soil temperature

3. loss of soil coverage

1 (c) explain how the change could set the stage for the takeover of Japanese stilt grass or other exotic species. - CORRECT ANSWER-"the exotic species are often more tolerant than native species of drier soils, and therefore, out-compete native species"

1 (d) Design a controlled experiment to determine whether the worms, in fact, do change the forest ecosystem. Identify the environmental factor you will measure, and include the specific hypothesis you will test and the data you will collect. - CORRECT ANSWER-

The Alaskan National Wildlife Refuge (ANWR) on Alaska's North Slope is frequently in the news because petroleum geologists estimate that there are billions of barrels of economically recoverable oil beneath the surface of its frozen tundra. According to a 1998 United States Geological Survey (USGS) estimate, ANWR could contain up to 10 billion barrels of technically recoverable oil. Oil company officials advocate opening the refuge to oil exploration and the subsequent development of its petroleum resources. Environmentalists argue that oil exploration and development will damage this fragile ecosystem and urge Congress to protect ANWR by designating it as a wilderness area. - CORRECT ANSWER-question 2

Indonesian Primates Sharon Gursky-Doyen, Jatna Supriatna, 2010-01-15 Indonesia possesses the second largest primate population in the world with over 33 different primate species. Although Brazil possesses more primate species, Indonesia outranks it in terms of its diversity of primates ranging from prosimians, slow lorises and tarsiers to a multitude of Old World Monkey species, macaques, langurs, proboscis monkeys, to lesser apes, siamangs, gibbons and great apes, orangutans. The primates of Indonesia are distributed throughout the archipelago. Partly in response to the number of primates distributed throughout the Indonesian archipelago, Indonesia is classified as the home of two biodiversity hotspots, Wallacea and Sundaland. In order to be classified as a hotspot, an area must have a large proportion of endemic species coupled with a high degree of threat, including having lost more than 70% of its original habitat. Two areas within Indonesia meet these criteria. The tremendous diversity of primates in Indonesia in conjunction with the conservation issues facing the primates of this region created a need for this volume.

Number without language: comparative psychology and the evolution of numerical cognition Christian Agrillo, Michael Beran, 2013-07-09 Despite once being reserved as perhaps a unique human ability and one reliant on language comparative and developmental research has shown that numerical abilities predate verbal language Human infants and several non human species have been shown to represent numerical information in varied contexts and the capacity to discriminate both small and large numerosities has been reported in mammals birds amphibians and fish The similar performances often observed across such diverse species have led to the hypothesis that there may be shared core systems underlying number abilities of non human species and human non verbal numerical abilities Thus animal models could provide useful insight on our comprehension of numerical cognition and in particular the evolution of non verbal numerical abilities Several aspects need be clarified For instance the ontogeny of numerical competence in animals has been rarely investigated It is unclear whether all species can represent

numerical information or on the contrary use non numerical continuous quantities that co vary with number such as cumulative surface area density and space In addition the existence of a specific mechanism to process small numbers
