

The functions of the digestive system are:

1. **Ingestion.** Food must be placed into the mouth before it can be acted on; this is an active, voluntary process called ingestion.
2. **Propulsion.** If foods are to be processed by more than one digestive organ, they must be propelled from one organ to the next; swallowing is one example of food movement that depends largely on the propulsive process called **peristalsis** (involuntary, alternating waves of contraction and relaxation of the muscles in the organ wall).
3. **Food breakdown: mechanical digestion.** Mechanical digestion prepares food for further degradation by enzymes by physically fragmenting the foods into smaller pieces, and examples of mechanical digestion are: mixing of food in the mouth by the tongue, churning of food in the stomach, and segmentation in the small intestine.
4. **Food breakdown: chemical digestion.** The sequence of steps in which the large food molecules are broken down into their building blocks by enzymes is called chemical digestion.
5. **Absorption.** Transport of digested end products from the lumen of the GI tract to the **blood** or lymph is absorption, and for absorption to happen, the digested foods must first enter the mucosal cells by active or passive transport processes.
6. **Defecation.** Defecation is the elimination of indigestible residues from the GI tract via the anus in the form of **feces**.

Anatomy of the Digestive System

The organs of the digestive system can be separated into two main groups: those forming the alimentary canal and the accessory digestive organs.
