## BACKGROUND

**Biomass** is biological material from plants or animals that is either living or has recently living. (Environmental Literacy Council, 2008c). Biomass, along with other renewable energy sources such as wind, solar, geothermal, hydrogen, and hydropower, can help to meet growing energy demands in the United States (U.S.) and globally. When biomass is converted into electricity, heat, power, or transportation fuels, it is called biomass energy, or bioenergy. Examples of bioenergy resources are food crops like sugarcane and corn, grassy and woody plants, agricultural and forestry residues, municipal and industrial solid wastes, and landfill gas (HARF, 2006). Biomass is a renewable energy resource because trees and plants can be grown, harvested, and

re-grown in a short period of time. In addition, this process occasionally produces residue, manure, and gas.

People have been using biomass in the form of firewood for centuries to cook food, heat homes, and produce steam. Currently, many people in developing countries depend on burning biomass to provide heat for both cooking and heating.
