The three dimensional structure and function of molecules present many challenges and opportunities for developing an understanding of biological systems. With the increasing availability of molecular structures and the advancing accuracy of structure predictions and molecular simulations the space for algorithmic advancement on many analytical and predictive problems is both broad and deep. To support this field a rich set of methods and algorithms are available addressing a variety of important problems such as protein protein interactions, the effect of mutations on protein structure and function and protein structure determination. Despite recent advancements in the field in particular in protein folding with the development of AlphaFold many problems still remain unsolved. In this book we focus on a number of topics in Structural Bioinformatics: Cryo EM structural detection, protein conformational exploration, elucidation of molecular binding surface using geometry, the effect of mutations, insertions and deletions on protein structural stability and protein ligand binding.
