

Abstract

- 1) It appears configuration is correct. Why does the device not see the IP? Is there a firewall blocking traffic on the interface? Is the configured bridge ID the correct one? Is the configured IP address in the correct subnet? (Check whether you used the correct bridge and IP) (Correct)
- 2) Is the configured bridge type possibly not the correct one? Is there a VLAN configuration that might be blocking the traffic? (Correct) If not, check that it is not blocked (Correct)
 - What does the IP configuration show?

This must clearly demonstrate that IP address cannot be reached using the currently configured all by itself. This will be either by not in the correct network or not

 - How do you know?

This shows that we selected the IP address from the DHCP server that was not configured the correct way, that the gateway address and subnet mask is this.

 - What other information is displayed?

Therefore, the IP address, selected mask and default gateway
- 3) Upon looking at the output, we see:
 - What is the IP address?

The network is 10.10.10.0/24

 - What is the IP address of the PC?

It should be something like 10.10.10.10

 - What is the IP address of your PC?

It should be your PC's address
- 4) Upon looking at the output, we see that the gateway address of the PC is not the correct one. (Correct)
- 5) Upon looking at the output, we see:
 - What does the PC show?

Therefore, just entered your IP address back to the switch.
- 6) Upon looking at the output, we see:
 - What does the PC show?

Therefore, just entered a correct address from the DHCP server.
