

The Digestive System

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food enters through the mouth, is broken down in the stomach, and then moves through the small intestine, where nutrients are absorbed. The digestive system also includes accessory organs that help in the process, such as the liver, pancreas, and gallbladder.

Liver, pancreas & gallbladder

After leaving the stomach, chyme moves into the duodenum, the first part of the small intestine, where it is mixed with bile secreted by the **liver** and pancreatic juice secreted by the **pancreas**. This area is a mixing region on the intestine where the digestive system continues. The **gallbladder** stores bile and releases it into the duodenum.

Layers of large intestine

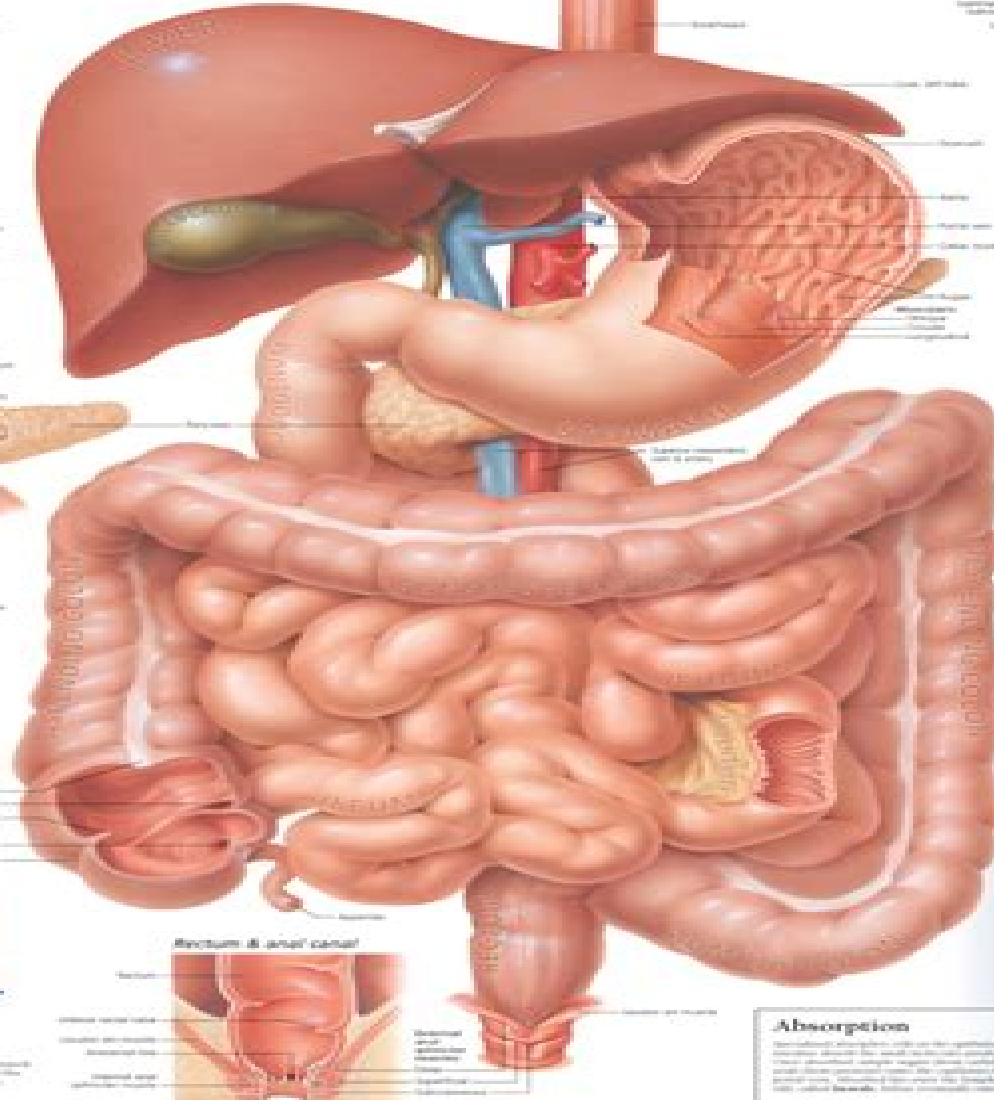

Large intestine

The large intestine consists of the cecum, the caecum, the ascending colon, the transverse colon, the descending colon, the sigmoid colon, and the rectum. The large intestine is responsible for absorbing water and electrolytes from the undigested food and forming feces.

Peristaltic action

Food material is pushed through the digestive system by a series of powerful muscular contractions called peristalsis. These contractions move the material forward and the wave which, when it moves, the material is pushed forward.

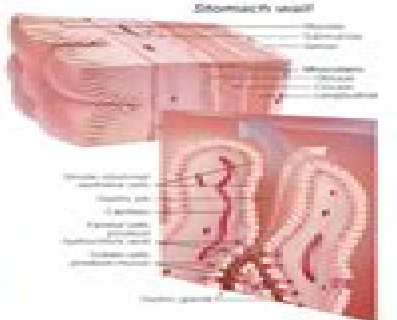

The mouth & salivary glands

Chewing the food breaks it into smaller pieces, making it easier to swallow. Saliva, secreted by the salivary glands, moistens the food and helps in the digestion of carbohydrates. Saliva also contains enzymes that help in the digestion of food.

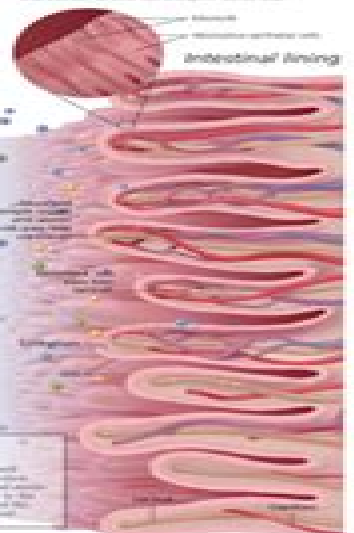

The stomach

The stomach is a large, muscular organ that is responsible for storing and mixing food with gastric juices. It is located in the upper left part of the abdomen. The stomach wall is composed of several layers, including the mucosa, submucosa, muscularis, and serosa.

Small intestine

The small intestine consists of three parts: the duodenum, the jejunum, and the ileum. It is responsible for the majority of the digestion and absorption of nutrients. The small intestine is highly coiled and has a large surface area for absorption.

Absorption

The process of absorption involves the movement of nutrients from the small intestine into the bloodstream. This process occurs in the villi, which are small finger-like projections that increase the surface area of the intestinal lining.
