From Chemical to Biological Organization Mario Markus, Stefan C. Müller, Gregoire Nicolis, 2012-12-06
Open nonlinear systems are capable of self organization in space and time This realization constitutes a major breakthrough of modern science and is currently at the origin of explosive developments in chemistry physics and biology Observations and numerical computations of nonlinear systems surprise us by their inexhaustible and sometimes nonintuitive variety of structures with different shapes and functions But as well as variety one finds on closer inspection that nonlinear phenomena share universal aspects of pattern formation in time and space These similarities make it possible to bridge the gap between inanimate and living matter at various levels of complexity in both theory and experiment This book is an account of different approaches to the study of this pattern formation The universality of kinetic thermodynamic and dimensional approaches is documented through their application to purely mathematical physical and chemical systems as well as to systems in nature biochemical cellular multicellular physiological neurophysiological ecological and economic systems Hints given throughout the book allow the reader to discover how to make use of the principles and methods in different fields of research including those not treated explicitly in the book

Mathematics in Population Biology Horst R. Thieme, 2018-06-05 The formulation analysis and re evaluation of mathematical models in population biology has become a valuable source of insight to mathematicians and biologists alike This book presents an overview and selected sample of these results and ideas organized by biological theme rather than mathematical concept with an emphasis on helping the reader develop appropriate modeling skills through use of well chosen and varied examples Part I starts with unstructured single species population models particularly in the framework of continuous time models then adding the most rudimentary stage structure with variable stage duration The theme of stage structure in an age dependent context is developed in Part II covering demographic concepts such as life expectation and variance of life length and their dynamic consequences In Part III the author considers the dynamic interplay of host and parasite populations i e the epidemics and endemics of infectious diseases The theme of stage structure continues here in the analysis of different stages of infection and of age structure that is instrumental in optimizing vaccination strategies Each section concludes with exercises some with solutions and suggestions for further study The level of mathematics is relatively modest a toolbox provides a summary of required results in differential equations integration and integral equations In addition a selection of Maple worksheets is provided The book provides an authoritative tour through a dazzling ensemble of topics and is both an ideal introduction to the subject and reference for researchers

Applied Mathematical Ecology Simon A. Levin, Thomas G. Hallam, Louis J. Gross, 2012-12-06 The Second Autumn

Course on Mathematical Ecology was held at the International Centre for Theoretical Physics in Trieste Italy in November and December of 1986 During the four year period that had elapsed since the First Autumn Course on Mathematical Ecology sufficient progress had been made in applied mathematical ecology to merit tilting the balance maintained between theoretical aspects and applications in the 1982 Course toward applications The course format while similar to that of the first Autumn Course on Mathematical Ecology consequently focused upon applications of mathematical ecology Current areas of application are almost as diverse as the spectrum covered by ecology The topics of this book reflect this diversity and were chosen because of perceived interest and utility to developing countries Topical lectures began with foundational material mostly derived from Mathematical Ecology An Introduction a compilation of the lectures of the 1982 course published by Springer Verlag in this series Volume 17 and when possible progressed to the frontiers of research In addition to the course lectures workshops were arranged for small groups to supplement and enhance the learning experience Other perspectives were provided through presentations by course participants and speakers at the associated Research Conference Many of the research papers are in a companion volume Mathematical Ecology Proceedings Trieste 1986 published by World Scientific Press in 1988 This book is structured primarily by application area Part II provides an introduction to mathematical and statistical applications in resource management **JJAP**, 1997 Geometry and Topology of Submanifolds, X Weihuan Chen, 2000 <http://www.worldscientific.com/worldscibooks/10.1142/4569> *Complexity, Chaos, and Biological Evolution* Erik Mosekilde, Lis Mosekilde, 2013-03-08 From time to time perhaps a few times each century a revolution occurs that questions some of our basic beliefs and sweeps across otherwise well guarded disciplinary boundaries These are the periods when science is fun when new paradigms have to be formulated and when young scientists can do serious work without first having to acquire all the knowledge of their teachers The emergence of nonlinear science appears to be one such revolution In a surprising manner this new science has disclosed a number of misconceptions in our traditional understanding of determinism In particular it has been shown that the notion of predictability according to which the trajectory of a system can be precisely determined if one knows the equations of motion and the initial conditions is related to textbook examples of simple integrable systems This predictability does not extend to nonlinear conservative systems in general Dissipative systems can also show unpredictability provided that the motion is sustained by externally supplied energy and/or resources These discoveries and the associated discovery that even relatively simple nonlinear systems can show extremely complex behavior have brought about an unprecedented feeling of common interest among scientists from many different disciplines During the last decade or two we have come to understand that there are universal routes to chaos we have learned about stretching and folding and we have discovered the beautiful fractal geometry underlying chaotic attractors *Geometry And Topology Of Submanifolds X: Differential Geometry In Honor Of Professor S S Chern* Weihuan Chen, An-min Li, Udo Simon, Leopold Verstraelen, Changping Wang, Martin Wiehe, 2000-11-07 Contents
