Table 1 shows the tests and the student's observations for solid P.

Tests	Observations
Test 1 Heat about half of solid P in boiling tube until there is no further change.	<u>disappears + effs</u> the white solid forms a colourless liquid, steam effervesces out from the boiling tube and condensation is seen at the top of the boiling tube. after a while the colourless liquid becomes a white solid.
Test 2 The remaining solid P is dissolved in water to form solution P. Solution P is divided into three portions. To the first portion of solution P, a glowing splint, with a glowing <u>blue</u> flame, is held over the mouth of the boiling tube and then is removed. Repeat the procedure and then bring red litmus paper at the mouth of the boiling tube.	<u>no effs</u> <u>no H₂ gas</u> <u>no H₂ gas</u> <u>no change</u> The glowing red litmus paper remains red.
Test 3 To the second portion of solution P, a few drops of dilute <u>hydrochloric acid</u> are added.	<u>white precipitate</u> <u>SO₄²⁻</u>
Test 4 To the third portion of solution P, with a few drops of acidified aqueous potassium manganate(VII),	the solution becomes light purple <u>purple → fading</u> <u>SO₃²⁻</u>

30. The observations in test 1 show that solid P is hydrated.

31. Suggest a chemical test to show that the condensation at the top of the boiling tube contains water.

Matus, Simone Diego Castellarin, Giovanni Battista Tornielli, 2019-12-06 Fruits play a substantial role in the human diet as a source of vitamins minerals dietary fiber and a wide range of molecules relevant to health promotion and disease prevention The characterization of genes involved in the accumulation of these molecules during fruit development and ripening and in the overall plant's response to the environment constitutes a fundamental step for improving yield and quality related traits and for predicting this crop's behavior in the field This is certainly the case for grapevine *Vitis vinifera* L one of the most largely cultivated fruit crops in the world The cultivation of this species is facing challenging scenarios driven by climate change including increases in atmospheric carbon dioxide CO₂ solar radiation and earth surface temperature and decreases of water and nutrient availability All these events will potentially affect the grapevine phenology physiology and metabolism in many growing regions and ultimately affect the quality of their fruits and of the most important derived product the wine The sequencing of the grapevine genome has given rise to a new era characterized by the generation of large scale data that requires complex computational analyses Numerous transcriptomic and metabolomic studies have been performed in the past fifteen years providing insights into the gene circuits that control the accumulation of all sorts of metabolites in grapevines From now on the integration of two or more omics will allow depicting gene transcript metabolite networks from a more holistic i.e systems perspective This eBook attempts to support this new direction by gathering innovative studies that assess the impact of genotypes the environment and agronomical practices on fruits at the ome scale The works hereby collected are part of a Research Topic covering the use of omics driven strategies to understand how environmental factors and agronomical practices including microclimate modification e.g sunlight incidence or temperature water availability and irrigation and postharvest management affect fruit development and composition These studies report well settled transcriptomic and metabolomic methods in addition to newly developed techniques addressing proteome profiles genome methylation landscapes and ionomic signatures some of which attempt to tackle the influence of terroir i.e the synergic effect of micro climate soil composition grape genotype and vineyard practices A few reviews and opinions are included that focus on the advantages of applying network theory in grapevine research Studies on vegetative organs in their relation to fruit development and on fruit derived cell cultures are also considered

Advances toward improved understanding and treatment of uncommon ovarian cancer types and subtypes Robb Hollis, Mihaela Carmen Cristea, Mignon Van Gent, 2024-10-22 Ovarian cancer is an umbrella term for a collection of distinct disease entities histotypes Until now the majority of research has focussed on the most common histotype high grade serous ovarian carcinoma HGSOC which accounts for 70% of cases The less common histotypes including endometrioid clear cell mucinous low grade serous carcinosarcoma and non epithelial histotypes have received far less research attention Accordingly while major advances in our understanding of HGSOC have led to

molecularly directed therapies that improve patient outcomes progress in less common histotypes has lagged behind Notably many of the uncommon histotypes demonstrate resistance to conventional chemotherapy regimens and their inherent biological differences suggest most are unlikely to respond to emerging molecular therapeutics designed to target the biology of common ovarian cancer types
