Coolant Flow Chart

Powerstroke has a pressure-cooled system for cooling the engine. The cooling system consists of the engine, radiator, water pump, and thermostat. The engine is cooled by the coolant which circulates through the radiator and back to the engine.

The thermostat is a valve which opens and closes to allow the coolant to flow through the radiator. When the engine temperature is below 175°F (79°C), the thermostat closes and the coolant flows through the engine only. When the engine temperature rises above 175°F (79°C), the thermostat opens and the coolant flows through the radiator. When the coolant temperature rises above 195°F (91°C), the thermostat opens and the coolant flows through the radiator. The coolant flows through the radiator and back to the engine.

At the end of the system, the coolant flows through the radiator and back to the engine. The coolant is cooled by the radiator and the engine is cooled by the coolant.

The system is pressurized by the radiator cap. As the engine heats up, the coolant in the radiator and engine expands. The pressure in the radiator and engine is maintained by the radiator cap. The radiator cap is a valve which opens and closes to allow the coolant to flow through the radiator and back to the engine.

The radiator cap has two valves. One is a pressure valve which opens at 15 psi (1.0 bar). The other is a vacuum valve which opens at 10 psi (0.7 bar). The pressure valve opens and allows the coolant to flow through the radiator and back to the engine. The vacuum valve opens and allows the coolant to flow through the radiator and back to the engine.
