

The human skeleton is composed of 206 bones, which are divided into the axial skeleton (skull, spine, and rib cage) and the appendicular skeleton (arms and legs). The bones are made of a hard, mineralized tissue called bone, which is constantly being renewed and repaired. The process of bone formation is called ossification, and it involves the deposition of calcium and other minerals into a matrix of collagen fibers. The bones are connected to each other by joints, which allow for movement. The joints are classified into three types: fibrous joints, cartilaginous joints, and synovial joints. The synovial joints are the most common and allow for the greatest range of motion. They are characterized by the presence of a synovial cavity, which is filled with a lubricating fluid called synovial fluid. The bones are also connected to muscles, which provide the force for movement. The muscles are made of muscle tissue, which is composed of muscle fibers. The muscle fibers are long, cylindrical cells that contain many mitochondria and myofibrils. The myofibrils are the contractile units of the muscle, and they are made of actin and myosin filaments. The actin filaments are thin and the myosin filaments are thick. They interact with each other to produce contraction. The contraction of the muscles is controlled by the nervous system, which sends electrical impulses to the muscle fibers. These impulses cause the release of calcium ions, which then bind to the actin filaments, allowing the myosin filaments to pull them and cause contraction.

The human arm and hand are composed of several bones. The humerus is the bone of the upper arm, and it is connected to the scapula and clavicle. The radius and ulna are the bones of the forearm, and they are connected to each other by a joint called the radio-ulnar joint. The carpals are the bones of the wrist, and they are connected to the radius and ulna. The metacarpals and phalanges are the bones of the hand and fingers. They are connected to each other by joints called the metacarpophalangeal joints and the interphalangeal joints. The bones of the arm and hand are made of bone, which is a hard, mineralized tissue. They are constantly being renewed and repaired, and the process of bone formation is called ossification. The bones are connected to muscles, which provide the force for movement. The human leg and foot are composed of several bones. The femur is the bone of the thigh, and it is connected to the pelvis. The tibia and fibula are the bones of the lower leg, and they are connected to each other by a joint called the tibio-fibular joint. The tarsals are the bones of the ankle, and they are connected to the tibia and fibula. The metatarsals and phalanges are the bones of the foot and toes. They are connected to each other by joints called the metatarsophalangeal joints and the interphalangeal joints. The bones of the leg and foot are made of bone, which is a hard, mineralized tissue. They are constantly being renewed and repaired, and the process of bone formation is called ossification. The bones are connected to muscles, which provide the force for movement. The human skull is composed of several bones. The cranium is the part of the skull that encloses the brain, and it is made of eight bones. The facial bones are the part of the skull that form the face, and they are made of 14 bones. The skull is made of bone, which is a hard, mineralized tissue. It is constantly being renewed and repaired, and the process of bone formation is called ossification. The skull is connected to the spine, which is the central part of the skeleton. The spine is made of vertebrae, which are the bones of the back. They are connected to each other by joints called the intervertebral joints. The spine is made of bone, which is a hard, mineralized tissue. It is constantly being renewed and repaired, and the process of bone formation is called ossification. The spine is connected to the ribs, which are the bones of the chest. They are connected to the spine by joints called the costovertebral joints. The ribs are made of bone, which is a hard, mineralized tissue. They are constantly being renewed and repaired, and the process of bone formation is called ossification. The ribs are connected to the sternum, which is the bone in the center of the chest. The sternum is made of bone, which is a hard, mineralized tissue. It is constantly being renewed and repaired, and the process of bone formation is called ossification. The sternum is connected to the lungs, which are the organs in the chest. The lungs are made of lung tissue, which is composed of alveoli. The alveoli are small, sac-like structures that are the site of gas exchange. The lungs are connected to the trachea, which is the windpipe. The trachea is made of cartilage, which is a flexible, rubbery tissue. It is constantly being renewed and repaired, and the process of cartilage formation is called chondrogenesis. The trachea is connected to the larynx, which is the voice box. The larynx is made of cartilage, which is a flexible, rubbery tissue. It is constantly being renewed and repaired, and the process of cartilage formation is called chondrogenesis. The larynx is connected to the pharynx, which is the part of the throat at the back of the mouth. The pharynx is made of muscle and cartilage. It is constantly being renewed and repaired, and the process of tissue repair is called regeneration. The pharynx is connected to the esophagus, which is the part of the digestive system that carries food from the mouth to the stomach. The esophagus is made of muscle. It is constantly being renewed and repaired, and the process of tissue repair is called regeneration. The esophagus is connected to the stomach, which is the part of the digestive system that stores and digests food. The stomach is made of muscle. It is constantly being renewed and repaired, and the process of tissue repair is called regeneration. The stomach is connected to the small intestine, which is the part of the digestive system that absorbs nutrients from food. The small intestine is made of muscle. It is constantly being renewed and repaired, and the process of tissue repair is called regeneration. The small intestine is connected to the large intestine, which is the part of the digestive system that absorbs water and electrolytes from food. The large intestine is made of muscle. It is constantly being renewed and repaired, and the process of tissue repair is called regeneration. The large intestine is connected to the rectum, which is the part of the digestive system that stores feces. The rectum is made of muscle. It is constantly being renewed and repaired, and the process of tissue repair is called regeneration. The rectum is connected to the anus, which is the opening of the digestive system. The anus is made of muscle. It is constantly being renewed and repaired, and the process of tissue repair is called regeneration.

The human torso and back are composed of several muscles. The pectoralis major is the muscle of the chest, and it is connected to the sternum and the humerus. The latissimus dorsi is the muscle of the back, and it is connected to the spine and the humerus. The trapezius is the muscle of the neck and back, and it is connected to the spine and the skull. The muscles of the torso and back are made of muscle tissue, which is composed of muscle fibers. The muscle fibers are long, cylindrical cells that contain many mitochondria and myofibrils.
