Summaries of Projects Completed in Fiscal Year ..., 1977 *Summaries of Projects Completed* National Science Foundation (U.S.), *The Joy of Factoring* Samuel S. Wagstaff (Jr.), 2013-10-24 This book is about the theory and practice of integer factorization presented in a historic perspective It describes about twenty algorithms for factoring and a dozen other number theory algorithms that support the factoring algorithms Most algorithms are described both in words and in pseudocode to satisfy both number theorists and computer scientists Each of the ten chapters begins with a concise summary of its contents This book is written for readers who want to learn more about the best methods of factoring integers many reasons for factoring and some history of this fascinating subject It can be read by anyone who has taken a first course in number theory Publisher website

Commutative Algebra David Eisenbud, 2013-12-01 Commutative Algebra is best understood with knowledge of the geometric ideas that have played a great role in its formation in short with a view towards algebraic geometry The author presents a comprehensive view of commutative algebra from basics such as localization and primary decomposition through dimension theory differentials homological methods free resolutions and duality emphasizing the origins of the ideas and their connections with other parts of mathematics Many exercises illustrate and sharpen the theory and extended exercises give the reader an active part in complementing the material presented in the text One novel feature is a chapter devoted to a quick but thorough treatment of Grobner basis theory and the constructive methods in commutative algebra and algebraic geometry that flow from it Applications of the theory and even suggestions for computer algebra projects are included This book will appeal to readers from beginners to advanced students of commutative algebra or algebraic geometry To help beginners the essential ideals from algebraic geometry are treated from scratch Appendices on

homological algebra multilinear algebra and several other useful topics help to make the book relatively self contained Novel results and presentations are scattered throughout the text

Learning Math Through Visual Art and Hands on Projects Javier S. Guerrero, *Projects in Scientific Computation* Richard E. Crandall, 2000-06-22 This interdisciplinary book provides a compendium of projects plus numerous example programs for readers to study and explore Designed for advanced undergraduates or graduates of science mathematics and engineering who will deal with scientific computation in their future studies and research it also contains new and useful reference materials for researchers The problem sets range from the tutorial to exploratory and at times to the impossible The projects were collected from research results and computational dilemmas during the authors tenure as Chief Scientist at NeXT Computer and from his lectures at Reed College The content assumes familiarity with such college topics as calculus differential equations and at least elementary programming Each project focuses on computation theory graphics or a combination of these and is designed with an estimated level of difficulty The support code for each takes the form of either C or Mathematica and is included in the appendix and on the bundled diskette The algorithms are clearly laid out within the projects such that the book may be used with other symbolic numerical and algebraic manipulation products

A Course in Computational Algebraic Number Theory Henri Cohen, 2013-04-17 With the advent of powerful computing tools and numerous advances in mathematics computer science and cryptography algorithmic number theory has become an important subject in its own right Both external and internal pressures gave a powerful impetus to the development of more powerful algorithms These in turn led to a large number of spectacular breakthroughs To mention but a few the LLL algorithm which has a wide range of applications including real world applications to integer programming primality testing and factoring algorithms sub exponential class group and regulator algorithms etc Several books exist which treat parts of this subject It is essentially impossible for an author to keep up with the rapid pace of progress in all areas of this subject Each book emphasizes a different area corresponding to the author s tastes and interests The most famous but unfortunately the oldest is Knuth s Art of Computer Programming especially Chapter 4 The present book has two goals First to give a reasonably comprehensive introductory course in computational number theory In particular although we study some subjects in great detail others are only mentioned but with suitable pointers to the literature Hence we hope that this book can serve as a first course on the subject A natural sequel would be to study more specialized subjects in the existing literature

Computation and Comparison of Efficient Turbulence Models for Aeronautics — European Research Project ETMA Alain Dervieux, Marianna Braza, Jean-Paul Dussauge, 2013-04-17 The computation of complex turbulent flows by statistical modelling has already a long history The most popular two equation models today were introduced in the early seventies However these models have been generally tested in rather academic cases The development of computers has led to more and more accurate numerical methods The interactions between numerical and modelling techniques are generally not well

mastered Moreover computation of real life cases including 3D effects complex geometries and pressure gradients based on two equation models with low Reynolds treatment at the proximity of walls are not really of common use A large number of models has been proposed this is perhaps the sign that none of them is really satisfactory and then the assessment of their generality is not an easy task it requires a lot of understanding of the physics and a lot of work for testing the large number of relevant cases in order to assess their limits of validity which is a condition for an improved confidence in engineering applications This is probably why workshops and working groups are frequent and the ETMA consortium has chosen to build a state of the art in theoretical and numerical statistical turbulence modelling for real life computations by taking some marks with respect to previous workshops such as the Stanford meetings 1980 1981 some problems are kept or updated by new experiments some problems are discarded some new problems are introduced the focus is kept on flows with 2D geometries

Risk, Capital Costs, and Project Financing Decisions F.G.J. Derkinderen, R.L. Crum, 2012-12-06 The ending of the decade of the seventies and the dawning of the eighties can be characterized as a period of great uncertainty with prospects for economic political instability High inflation and fluctuating exchange rates in the developed Western world have served to strengthen the forces of disequilibrium in the financial markets leading to an investment situation with several unusual but significant factors Capital spending by business leading to the creation of new jobs has not been reduced substantially during this period of uncertainty as happened in similar periods in the past This is shown in part by the continuing low unemployment rates in evidence during the period which are in contradiction to the trend exhibited in similar past periods The expanding financing requirements resulting from high price inflation have led to an increase in the capital intensity of firms and thus to enhanced sensitivity of their income streams to economic fluctuations At the same time the record high interest rates that companies have had to pay to acquire this inflated amount of capital have caused a deterioration in the safety or quality indicators by which the creditworthiness of the firms is judged These developments tend to increase
