Experiment 8.1 – Implementing a Combinational Logic Circuit with Logic Gates, Multiplexers, and Registers

1. Introduction: This circuit is intended as a classroom exercise in which, beyond logic and computer design, we will use the `Verilog` language with various logic blocks in the lab course. Such a block diagram circuit could be set up in either hardware or in a digital simulation (e.g., `LogicWorks`).

It should be given the purpose of Experiment 8.1 is to implement a circuit with the various components which are the subject of this course, and to be particular, use the `Verilog` language to describe it. The circuit is a 4-bit adder, and is:

The circuit is shown:

We will implement the circuit in `Verilog` using the `Verilog` language. The circuit is shown in the `Verilog` code below. The circuit is shown in the `Verilog` code below.

2. Experimental Equipment: The following experimental equipment will be used for this experiment:

- 1. The `Verilog` language, which is used to describe the circuit in the `Verilog` code below.
- 2. The `Verilog` code below.
- 3. The `Verilog` code below.

The Dynamics of Digital Excitation Masakazu Shoji, 2012-12-06 The electronic circuit is a proud child of twentieth century natural science In a hundred short years it has developed to the point that it now enhances nearly every aspect of human life Yet our basic understanding of electronic circuit operation electronic circuit theory has not made significant progress during the semiconductor industry's explosive growth from 1950s to the present This is because the electronic circuit has never been considered to be a challenging research subject by physicists Linear passive circuit theory was established by the late 1940s After the advent of the semiconductor electron devices the interest of the technical community shifted away from circuit theory Twenty years later when integrated circuit technology began an explosive growth circuit theory was again left behind in the shadow of rapidly progressing computer aided design CAD technology The present majority view is that electronic circuit theory stands in a subordinate position to CAD and to device processing technology In 1950s and 1960s several new semiconductor devices were invented every year and each new device seemed to have some interesting fundamental physical mechanisms that appeared worth investigating Compared to attractive device physics the problems of the semiconductor device circuit appeared less sophisticated and less attractive Bright minds of the time drifted away from circuit theory to electron device physics After thirty years only one type of semiconductor device the electron triode with several variations survived whereas hundreds of them went into oblivion
